

FIG. 1

6081491-2596260

Figure 1 consists of 12 micrographs arranged in a vertical column, labeled 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, 6.5, and 7.0, representing days of incubation. The images show the progressive development of the chick embryo eye. At 1.5 days, a small, dark, undifferentiated spot is visible. By 2.0 days, the spot is slightly larger and more defined. At 2.5 days, the spot is larger and shows some internal structure. By 3.0 days, the spot is larger and more complex, with some internal structure visible. At 3.5 days, the spot is larger and more complex, with some internal structure visible. By 4.0 days, the spot is larger and more complex, with some internal structure visible. At 4.5 days, the spot is larger and more complex, with some internal structure visible. By 5.0 days, the spot is larger and more complex, with some internal structure visible. At 5.5 days, the spot is larger and more complex, with some internal structure visible. By 6.0 days, the spot is larger and more complex, with some internal structure visible. At 6.5 days, the spot is larger and more complex, with some internal structure visible. By 7.0 days, the spot is larger and more complex, with some internal structure visible.
